NO.19 A QlikView server environment is restarted multiple times. The system administrator finds this message in the QlikView Server event

logs:

Restart: Server aborted trying to recover by restart. Reason for restart: Phoenix detected: Performance monitor stuck.

Which are three possible causes for this error? (Select three)

* File locking

- * Memory shortage
- * Corrupt PGO files
- * Lack of permission
- * Corruption in performance counter library

NO.20 Business users report QlikView documents are having intermittent performance issues Users sometimes receive warnings related to memory. The system administrator finds this error message in the server log files:WorkingSet: Virtual Memory is growing beyond parameters

Which three steps should the administrator take to diagnose and fix this issue? (Select three.)

- * Ask the user to restart the client and/or browser, and try again
- * Increase the amount of free disk space on the server that runs the QlikView Server services
- * Review the Working Set High/Low values for QlikView Server in the QlikView Management Console
- * Ask the document owner to optimize the data model and memory usage of sheet objects in the document
- * Monitor the memory usage on the server that runs the QlikView Server services, and increase memory resources if needed

NO.21 A company has a QlikView developer that needs to license QlikView Personal Edition Which CAL type should a system administrator assign to the developer?

- * Usage CAL
- * Session CAL
- * Document CAL
- * Named User CAL

NO.22 A QlikView deployment contains two clustered QlikView Servers.

The QlikView Web Server Service (QVWS) has been installed on a different server than the QlikView Server services However the QlikView Web Server fails to start.

Which are two outcomes of this failure? (Select two.)

- * Users cannot access the AccessPoint
- * The AccessPoint displays the message: No web server
- * The QlikView Servers can no longer hold QlikView documents in RAM
- * The load balancing method for the QlikView Servers cannot be changed
- * The QlikView Management Console can no longer be accessed by the system administrator

NO.23 A system administrator tests a QlikView Server deployment to confirm connectivity between a web browser and the QlikView Server The test fails because connectivity to the AccessPoint maintains a loading content state. All QlikView services are running properly and there are NO error messages in any log files.

What should the administrator do to correct the problem?

- * Register ASP net 4.x on the server running IIS and QlikView web components
- * Set the QlikView IIS application pool identity to the local Administrator account

- * Stop and start the QlikView Webserver service to reset the QlikView web configuration
- * Stop and start IIS to reset connectivity between the QlikView web components and the QlikView

Server

NO.24 A system administrator needs to evaluate the CAL utilization in their organization Which tool should the administrator use?

- * The CALs tab in the QMC
- * The Governance Dashboard
- * The License Monitor application
- * The QVS Statistic window in the QMC

NO.25 An organization plans to purchase CALs for a new QlikView Server

Users are grouped into three categories based on how they will access and use QlikView

1. Two hundred and twenty users access a single application infrequently for short periods of time with a maximum of five concurrent users.
2. Five users work standard business hours and have access to four QlikView documents, each with a maximum of five concurrent users.
3. Two users are developers and only work on one QlikView document at a time. The developers must be able to use the Qlikview Desktop Client for development and the AccessPoint for testing.

Which is the most cost effective CAL configuration to meet the requirements?

- * 227 Named CALs
- * 5 Session CALs and 7 Named CALs
- * 220 Document CALs and 7 Named CALs
- * 10 Session CALs and 2 Document CALs

NO.26 There is a QlikView document with separate “City” and “State” fields A system administrator needs to create

separate QVW documents each with a singular “City and State” field.

Which method should the system administrator use?

- * Loop and reduce by “City” only
- * Loop and reduce by “City and State”
- * Concatenate “City” and “State” then loop and reduce by “City and State”
- * Concatenate “City” and “State” then loop and reduce by “City and State” bookmark

NO.27 A system administrator needs to create a QlikView Publisher task that triggers the execution of a Windows batch file on successful reload of a QlikView document.

Which task should the administrator create?

- * A Reload only task
- * A Loop and Reduce task
- * An External Program Supporting task
- * An Event Driven Execution (EDX) triggered task

NO.28 A system administrator wants to configure a SAN folder to store User Documents. The administrator wants to use NTFS to allow all users access to the QlikView documents.

Which permission should the administrator grant on the SAN folder?

- * Execute
- * Read & execute
- * Write
- * Allow

NO.29 The reloading of a QlikView document is dependent on an external file being created in a specific folder

A system administrator has developed a custom application that searches for the external file and communicates with the QlikView Management Service.

Which functionality of the QlikView Distribution Service should the administrator use to reload the QlikView document?

- * Set up a supporting task for the custom application
- * Set up an On a schedule trigger with a dependency on the custom application
- * Set up an On event from another task trigger initiated by the custom application
- * Use an Event Driven Execution (EDX) trigger that is initiated by the custom application

NO.30 The QlikView Distribution Service fails to allocate a QlikView Batch (QVB) engine. The system administrator needs to monitor the QlikView Publisher for 24 hours to determine if the current QlikView Publisher schedule has over-allocated QVB engines.

Which two tools should the administrator use? (Select two)

- * Wireshark
- * HTTP Watch
- * Microsoft Task Manager
- * QlikView Governance Dashboard
- * Microsoft Performance Monitor

NO.31 A QlikView developer has been assigned a Named User CAL. The developer is testing the same QlikView document on two different web browsers simultaneously. When switching between browsers and opening the AccessPoint this error message displays: Lost connection to server.

The system administrator finds this message in the Qlikview Server Session log file

Killed because Named User CAL was needed from another client.

The administrator needs to enable the developer to test the QlikView document on two different web browsers simultaneously

What should the administrator do?

- * Assign the developer a Local QlikView Desktop license
- * Assign the developer a Document CAL for the duration of the testing
- * Instruct the developer to download the QlikView document and test locally
- * Remove any Document or Named User CALs for the user so they will use Session CALs

NO.32 A QlikView document contains Section Access and reduces the data to the users based on usernames. When opening the documents all users are still able to see all data without any reductions.

Which QlikView Desktop setting is causing this result?

- * Strict Exclusion is unchecked
- * Initial Selection Based on Section Access is checked
- * Initial Selection Based on Section Access is unchecked
- * Initial Data Reduction Based on Section Access is unchecked

NO.33 A developer requests access to an API to execute reloads from external software. The developer is using NTFS security to authorize against the system.

Which two steps should a system administrator complete to provide the developer with the appropriate

permissions? (Select two.)

- * Turn off the firewall on the server with the QlikView Management Service
- * Ensure the QlikView Management Service runs in DMS mode and the developer's username and password are correct
- * Ensure the developer's document can access the QlikView Management Service on TCP port 4799 if a

firewall is configured

- * Add the developer to the QlikView Administrators local security group on the server with the QlikView

Management Service

- * Add the developer to the QlikView Management API local security group on the server with the

QlikView Management Service

NO.34 A system administrator is testing a QlikView Server where the Publisher is also licensed. After completing the testing phase, the system administrator wants to copy all tasks from the test environment to the production environment.

What should the system administrator do?

* Create a triggered task that will export all tasks from the test environment and import these tasks in the production

environment using Task Dependencies

* Export the tasks from the test environment using the QlikView Management Console and use the Paste icon to import the

tasks into the production environment

* Use the Remote Management Service to set up a link in the test environment towards the production environment and push

the tasks to the production environment.

* Use the Remote Management Service to set up a link in the production environment towards the test environment and pull the tasks into the production environment.

NO.35 A system administrator looks in the QMC > Status > QVS Statistics. No documents are open in the QlikView Server but the memory usage of the QlikView Server (QVS) process is still above 10 GB.

Which is the cause of this behavior?

- * Cached data for unloaded documents remains in memory to decrease calculation time
- * A reload is currently running that uses memory in the QlikView Server until it is finished
- * The Document Timeout setting is too high, which causes documents to never time out and unload
- * The Object Calculation Time Limit is too high, which causes the hypercube cache to stay for too long

NO.36 A system administrator needs to create a task that creates new QlikView documents with data associated with the Year field only. The QlikView documents need to be created using the Document Name and the values in the Year field.

What should the administrator do to meet the requirement?

* Set the Reduced Document name field to %SourceDocumentName% %yyyy% and the Simple Reduce value field to Year

* Set the Reduced Document name field to %SourceDocumentName% %yyyy% and the Loop and

Reduce with Field value field to Year

* Set the Reduced Document name field to %SourceDocumentName% %DocumentField,Year% and the

Simple Reduce value field to Year

* Set the Reduced Document name field to %SourceDocumentName% %DocumentField,Year% and the

Loop and Reduce with Field value field to Year

NO.37 A system administrator creates a task for a QlikView document with Section Access implemented. The administrator enters the correct values into the Data Protection fields to allow the QlikView service account to reload the file. When the task runs, it fails to reload the QlikView document

The administrator finds this error message in the QlikView distribution log file:

Error: Document open call failed.The document might require username and password.

What should the administrator do to resolve the task failure?

- * Add the QlikView service account to Section Access in the QlikView document
- * Enter an administrator username and password that is part of the Section Access
- * Validate the QlikView service account username and password are correct in the task
- * Ensure the QlikView service account has file permissions to read the QlikView document

Qlik QV12SA Exam Syllabus Topics:

TopicDetailsTopic 1- Determine an appropriate strategy to resolve a performance issue- Given a scenario, determine the appropriate CAL type to use and describe methods to apply CAL typesTopic 2- Differentiate between functionality of licensed and unlicensed Publisher- Determine the appropriate steps to identify issuesTopic 3- Describe how to proactively manage QlikView platform infrastructure- Determine an appropriate method to monitor tasksTopic 4- Given a scenario, determine the appropriate options for configuring a task- Explain the purpose of different QlikView servicesTopic 5- Determine the appropriate task type to meet customer requirements- Determine the cause of an environmental issueTopic 6- Determine the implications and outcomes of a specific configuration- Determine the cause of common performance issues
